**Let's Start!**

Which programming language can I use?

**Learning Outcome:**

Describe a general-purpose computer programming language in spoken and written situations.

Ask your partner:

- What other programming languages have you heard of different from C, C+, and C#?
- What programming language would you use to automatize tasks? Why?

Can Do Statements:

- I can understand written information about scripting languages like Perl, Ruby and Python.
- I can read and analyze basic information on other programming languages like Java and COBOL.
- I can write a text about information I recall on other popular programs.

Let's Explore!

Martha and Robert discuss scripting programming languages.

Instructions: Read the text below.

- Martha:** Hey, Robert. Are you working on the urgent things to do?
Robert: Sure! There are some tasks that I have not automatized yet. Yesterday, for example, I saw Mike taking information from the developing program to the base program manually. It represents a waste of precious time. I can program the computer to do it automatically.
- Martha:** Are you going to use C# to program this new task?
Robert: No. We are using scripting languages instead of base programming languages. The most commonly used, in cases like this, are Perl, Ruby, and Python.
- Martha:** Will it take much time?
Robert: No, Martha. As there is no need to compile these languages before running them, the process won't take long.
- Martha:** Oh, I didn't know that! And, will it be expensive?
Robert: No. Actually, these languages are open source. They are available for free access and use, and they don't require additional system components. There haven't ever been any costs for licensing or using them.
- Martha:** Good! Any other issues?
Robert: Hmm, I've seen some other issues, but I haven't had much trouble handling them. I'm currently working on two things: Java programming for web applications and COBOL. The task with Java won't take long. Fortunately, there is no need to recompile the code once you use it on one platform and want to run it in another one. The one that worries me a little is the COBOL part.
- Martha:** Why? What is the problem with that one?
Robert: Well, COBOL is a very old programming language. We use it for maintenance of existing applications but not to develop new ones. I suggest migrating the programs based on COBOL to a more modern platform.
- Martha:** Well, we'll do it, then.

**Let's Practice!**

Robert mentions some characteristics of scripting languages.

Instructions: Proofread the sentences. Correct the mistakes.

1. Using Pearl, Ruby and Python in the company is not going being expensive since they are open source.
2. Will you to use Python in your next project?
3. Since there's no need to recompile the code, we will saving time.
4. We are attend a training on Perl next week.
5. Are Ruby going to be useful for our programming project?

**Let's Practice!**

Let's program in scripting languages!

Instructions: Write the words to correctly complete the sentences. Use words from the box below.

used COBOL / tried using / I haven't / haven't
ever / been

1. We haven't _____ Java for this project.
2. _____ recompiled the code once since it's programmed in Java.
3. There _____ been any costs for licensing or using open source languages.
4. We have _____ to maintain existing applications but not to develop new ones.
5. It's _____ necessary to migrate the programs based on COBOL to a more modern platform.

Extension Activity

Let's decide on the best programming language.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Make a comparative chart in which you describe scripting languages Perl, Ruby, Python and other programming languages like Java and COBOL.
- On the web, find more information about other scripting languages.
- Highlight the advantages of them and count the ones with the highest number of items.
- Write a text describing the best ones and present them to a partner.

Self-Assessment

Yes

No

- I compare scripting languages and programming languages.
- I find further information about programming languages.
- I explain the advantages of the best ones.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **trouble** (noun): difficulties, problems, inconveniences
e.g. I've seen some other issues, but I haven't had much trouble handling them.
- **licensing** (noun): a permission given by the appropriate authority to use something
e.g. There haven't ever been any costs for licensing or using them.
- **migrate** (verb): to carry information to a different environment
e.g. We use it for maintenance of existing applications but not to develop new ones; I suggest migrating the programs based on COBOL to a more modern platform.
- **compile** (verb): to put together
e.g. As there is no need to compile these languages before running them, the process won't take long.
- **open source** (noun): software that can be used, accessed, and modified freely, without costs of licensing or purchase
e.g. Actually, these languages are open source; they are available for free access and use.
- **automatized** (adjective): the quality of being done by automatic means
e.g. There are some tasks that I have not automatized yet.

Learning Points

Present Perfect: Negative Form

We use the **present perfect** to talk about events that started in the past but are still in progress now. Additionally, it is also used to talk about past actions that have an effect on the present somehow.

The structure of the **present perfect** is the following:

Subject + Have/has + verb (past participle) + complement

Examples:

*I **have** only **programmed** in C++.*

To make the **negative** form of the present perfect tense, use **not** or its contraction **n't** after **have** or **has**, depending on the subject.

Check the following structure:

Subject + Have/has + not + verb (past participle) + complement

Examples:

*She **has not used** Python before.*

*They **haven't trained** anyone to program in Perl.*

Note 1: You have to choose between **have** and **has** depending on the subject. If the subject is the third person singular, (he, she, it, or any proper noun that you can replace with any of these) you use **has**; for any other subject, you use **have**.

Note 2: The past participle of the verb depends on the type of verb (regular or irregular). If we use regular verbs, we only use the **-ed** ending because the past and past participle form of these verbs are the same. Contrastively, if we use irregular verbs, we must use their proper form. Remember that you must learn the past participle form of irregular verbs by heart; you cannot only add the **-ed** ending to them.

Past Simple

We use the **past simple** to refer to events that started and ended in the past. The structure is the following:

Subject + **verb in past form** + complement

Example:

*I **finished** checking the system components of the new language code.*

*I **taught** the programmers how to code using Java yesterday.*

Learning Points

To make negative statements in the **past simple**, we use the auxiliary **did not**.

This is the structure:

Subject + **did not** + verb (base form) + complement

Example:

*I **did not** finish the configuration on time.*

*The team **did not** have to transfer the information manually.*

To ask questions in the **past simple**, we use the auxiliary **did** at the beginning of the statement or right after the **wh-** question word.

(WH) + **Did** + subject + verb (base form) + complement

Example:

*What time **did** you send the information to the programmers yesterday?*

***Did** you find any problems with the software configuration?*

Examples

- *There are some tasks that I have not automatized yet.*
- *There haven't ever been any cost for licensing or using them.*
- *I've seen some other issues, but I haven't had much trouble handling them.*

Tips for Writing a Paragraph

There are some tips you should follow when writing paragraphs to talk about specific information.

When you write a paragraph, you should follow certain pieces of advice that could help you make clear and straightforward pieces of writing.

The first thing you must bear in mind is having a topic sentence. The topic sentence is the base that will endure the entire paragraph; it is the main idea that you will develop through the text. Then, you need some supporting ideas. These ideas help you build an accurate and organized definition of your topic. You also have to include reasons, examples, names, numbers, and figures. By using them, you will support the information that you are giving and ensure that your statements are substantiated.
