**Let's Start!****The Thousand Possibilities of Data Binding****Learning Outcome:**

Talk about principles, concepts, and characteristics of general-purpose computer programming language in spoken and written situations.

**Ask your partner:**

- What tools to bind data do you know about?
- What do you know about the .NET Framework?

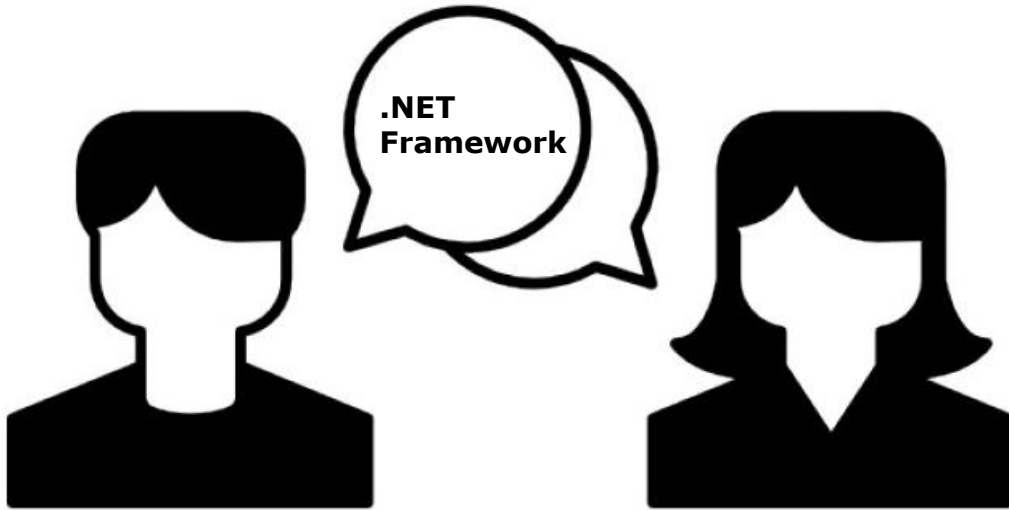

**Can Do Statements:**

- I can list some example situations to use data binding.
- I can talk about the types of data binding in the .NET framework.
- I can describe some scenarios that employ data binding.

### Let's Explore!

You'd rather use .NET Framework.

*Instructions: Read the text below.*

**Alice:** Hi, Tony. What have you been up to since the last time we met?

**Tony:** Alice, I have started a new job on data binding.

**Alice:** Interesting. I worked on that last year. We used the .NET framework to bind texts and other contents.

**Tony:** .NET Framework? I'm using traditional data binders.

**Alice:** Really? I'd rather you use .NET Framework to bind data. With .NET Framework you not only bind data, but also any structure of data; the way data appears on the source is not important. Let me give you some examples: With .NET you can set properties, such as the control for graphs and images, and the background color and size of the controls.

**Tony:** You're right. I'd rather work with .NET Framework from now on. What types of data binding are there?

**Alice:** There are two types of data binding: simple and complex data binding; I used simple data binding when I wanted to join a control to a single element from a data set. For example, a value in a column. If you are working with sets of data, you'd rather use the complex data binding, which consists in binding controls to more than one data element or even to different binding data types. Datagrid and Listbox are good examples of it.

**Tony:** Interesting, what are some common scenarios for data binding with .NET?

**Alice:** Almost every commercial application uses data binding to display information. Reporting requires lists and summaries that need to be displayed on the document. Data entry, which consists of data shown in boxes, is also a common scenario for data binding; master and detail apps, also use .NET to establish relationships between charts, and look up tables controlled by a combo box.

## Let's Practice!

### Some Situations to Use Data Binding

*Instructions: Match column A with Column B.*

#### COLUMN A

1. I have started
2. I worked
3. We used the .NET framework
4. I'd rather you use .NET
5. With .NET framework I didn't only bind data,
6. With .NET I have set properties

#### COLUMN B

- a. to bind texts and other contents.
- b. framework to bind data.
- c. but also other structures.
- d. on that last year.
- e. as the control for graphs and images.
- f. a new job on data binding.

## Let's Practice!

### Types of Data Binding in the .NET Framework

*Instructions: Read the sentences. Type in the missing words. Use: d, have, read, rather, wanted*

1. I'd \_\_\_\_\_ work with .NET Framework.
2. I \_\_\_\_\_ seen two types of data binding; simple and complex.
3. I used simple data binding when I \_\_\_\_\_ to join a control to a single element from a data set.
4. You' \_\_\_\_\_ rather use the complex data binding when you work with sets of data.
5. I have \_\_\_\_\_ that Datagrid and Listbox are good examples of complex data binding.

### Extension Activity

#### Taking About Data Binding

*Instructions: Complete the following steps. Fill in the Self-Assessment.*

- Prepare a presentation about data binding.
- Create a power point presentation or a poster in order to support your presentation.
- Explain how the two types of data binding work.
- Show your presentation to the class.

#### Self-Assessment

Yes

No

- I recognize some ways to use data binding.
- I talk about the types of data binding in the .NET framework.
- I explain how to effectively use data binding.

☐ ☐☐ ☐☐ ☐

### Target Words

- size** (noun): the area or extent, in this case, of a textbox  
e.g. With .NET you can set properties, such as the control for graphs and images, and the background color and size of the controls.
- control** (noun): the response of the charts displayed.  
e.g. You'd rather use the complex data binding, which consists of binding controls to more than one data element or even to different binding data types.
- data set** (compound noun): an amount of data  
e.g. When I wanted to join a control to a single element from a data set.
- bind** (verb): hold together  
e.g. You'd rather use the complex data binding, which consists of binding controls to more than one data element or even to different binding data types.
- background** (adjective): in this case, the base color of a graph  
e.g. With .NET you can set properties, such as the control for graphs and images, and the background color and size of the controls.
- join** (verb): to unite  
e.g. When I wanted to join a control to a single element from a data set.

## Learning Points

### Would Rather for What is Preferable

**Would rather** is an expression we use to talk about what we prefer instead of something else.

Use *would rather* plus the base form of verbs to express what you prefer. Remember that you can also contract would, this is more common in spoken English.

Follow this structure:

Subject + would rather + Verb in base form + Complement

Example:

*I **would rather use** the .net for data binding.*

*You'd **rather ask** Tim about the data binding type.*

To make a negative statement with would, you place the negation **not** between **rather** and the verb.

Example:

*I' **d rather not** bind data to that web site.*

When the preference refers to a different subject, you place that subject after **rather**.

Example :

*I' **d rather you** bind the data tonight.*

### Examples

- *Really? I'd rather you use .NET Framework to bind data.*
- *You're right. I'd rather work with .NET Framework from now on.*
- *If you are working with sets of data, you'd rather use the complex data binding, which consists in binding controls to more than one data element or even to different binding data types.*

### Learning Points

#### Present Perfect versus Simple Past

You can use both, simple past and present perfect, to talk about the past; still, depending on the idea you want to convey, one is proper than the other.

You can use both, **simple past** and **present perfect**, to talk about the past. However, depending on the idea you want to convey, one is more appropriate than the other.

**Simple past** is the tense we usually use when we talk about the **past** ; use simple past when you want to refer to events or actions that happened in the past. Simple past is commonly accompanied by a **past time expression**, which refers to the specific moment when the action took place.

Example:

*Last year I **had** to work with data gathering.*

The structure of the simple past is very simple:

Subject + Main verb (past form) + Complement

Remember that the verbs you use in past in the **affirmative** sentence can be **regular** and **irregular**.

The **present perfect** , on the other hand, is a tense that links **the past** and **the present** . This structure is used to recall a past event, or to refer to a fact that has a consequence, or a connection with the present. The moment when the action was done is not important, but the action itself is.

The present perfect uses the verb **to have** conjugated in present as an auxiliary verb plus the **past participle** of the main verb. Remember to learn the past participle of the irregular verbs.

Examples :

*I **have worked** with .NET twice.*

| Irregular verbs |             |                 |
|-----------------|-------------|-----------------|
| Base form       | Simple past | Past participle |
| say             | said        | Said            |
| make            | made        | Made            |
| go              | went        | Gone            |
| take            | took        | Taken           |
| come            | came        | Come            |
| see             | saw         | Seen            |
| know            | knew        | Known           |

#### Examples

- *I have started a new job on data binding.*
- *I worked on that last year, we used the .NET framework to bind texts and other contents.*
